

We analyzed the "Connection" story with *INVEST*:

- **I: Independent:** Partially: Login can work alone, BUT mentions "class/child/homework data" → already mixes with other features
- **N: Negotiable:** Yes: We can change username/email, UI design, etc.
- **V: Valuable:** Yes: Need login to access everything else.
- **E: Estimable:** No: 4 roles + (web/mobile) = can't estimate clearly.
- **S: Small:** No: Too big: backend + 4 UIs + security = many days.
- **T: Testable:** Partially:
 - Can test: username/password → JWT works
 - Can't test: "access data of class/child" = what exactly? Which screen? Which data? No clear success rule.

Suggestion (Story): Login API only → username/password → JWT + role!?
